NEURAL NETS

Introduction – Neural Nets

Quelle: <http://cs231n.github.io/convolutional-networks/>

Neuron Model

Mathematical view

- Input, weights
- Compute Sigmoid (activation function)
- Measure how much we missed (cost function)
- Multiply error by the Sigmoid slope
- Update weights (backpropagation)

$$l_0 = X_i, W = \text{rand}()$$

$$l_1 = \text{Sig}(X_i \cdot W)$$

$$\text{Err} = l_0 - l_1$$

$$\Delta l_1 = \text{Err} \cdot \Delta(\text{Sig}(\text{Err}))$$

$$W = W + \alpha(l_0 \cdot \Delta l_1)$$

Activation Functions

- Non-Linear
 - Sigmoid, tanh
- Continuous but not everywhere differentiable function
 - Relu

Activation functions - Sigmoid

- Motivation
 - Not telling in which direction should we move in.
 - Non-differentiability at certain points

Motivation for CNN

- Number of parameters

Motivation for CNN

■ NN

- High number of params

x_1	x_2	x_3
x_4	x_5	x_6
x_7	x_8	x_9

Number of
weights: 36

■ CNN

- Lower number of params

Number of
weights: 4

CONVOLUTIONAL NN

TensorFlow

- Developed by Google Brain team
- Use cases
 - Handwritten patterns, image recognition, Word2Vec
- Input data
 - Audio, image, text
- Used techniques
 - Linear classifiers, NN, CNN

Structure of the CNN we used

Input layer

- Image cropping
- Distortions
 - Randomly flipping
 - Randomly changing brightness
 - Randomly changing contrast

Convolutional layer - Filter

Input

0	0	0	0	0	0	0
0	2	1	0	0	2	0
0	2	2	2	0	2	0
0	1	2	0	2	0	0
0	2	1	2	1	2	0
0	1	2	1	0	0	0
0	0	0	0	0	0	0

Filter

0	0	0
0	2	1
0	2	2

Bias

1

Output

1

$$\begin{aligned}
 &1*0 + 2*0 + 0*0 + \\
 &0*0 + 0*2 + 0*1 + \\
 &0*0 + 0*2 + 0*2 + \\
 &1 = 1
 \end{aligned}$$

Convolutional layer - Parameters

- Input volume size
- Number of filters
- Filter size
- Step size
- Zero padding

Convolutional layer – Activation function

- Rectified linear
 - *Element Wise*: $\max(0, x)$
 - Pros:
 - Speeds up training
 - gradient computation is simple
 - Cons: vanishing gradient problem
 - Front layers train slowly

Pool layer – Max pooling

- Reduce the spatial dimension of an image

<http://cs231n.github.io/convolutional-networks/>

Norm layer

- 4D-array

- 3D-array of 1D-vector

- Normalize each element of this 1D-vector

Norm layer

- Normalize each element of this 1D-vector

$$a_1 = \left(\left(\frac{R}{\sqrt{R^2 + G^2 + B^2}} \right), \left(\frac{G}{\sqrt{R^2 + G^2 + B^2}} \right), \left(\frac{B}{\sqrt{R^2 + G^2 + B^2}} \right) \right)$$

Local layer

- Fully connected

x_1	x_2	x_3
x_4	x_5	x_6
x_7	x_8	x_9

Softmax-linear layer

- Softmax output function
- Cost measure for softmax

Softmax output function

- Soft continuous version of Max Function
- Forces $\sum(\text{Output of NN}) = 1$.

$$Y_i = \frac{e^{Z_i}}{\sum_{j \in \text{group}} e^{Z_j}}$$

Softmax output function

- $\frac{\delta Y_i}{\delta Z_i} = Y_i (1 - Y_i)$
- Nice Simple derivative
- Even though Y_i depends of Z_i ,
 - Derivative
 - for an individual neuron
 - of an O/P in respect to I/P is just $Y_i (1 - Y_i)$

Cost measure for softmax

- Cross entropy cost function
 - $\mathcal{C} = -\sum_j t_j \log Y_j$
 - Negative log probability of correct answer
 - Maximise the log probability of getting answer right
 - Very big gradient when O/P is 1 and target is 0
- $\frac{\delta \mathcal{C}}{\delta Z_i} = Y_i - T_i$
 - Slope is -1 when target values and actual value is opposite

HYPERPARAMETERS

Learning Rate

- How fast the network trains
- High learning rate
 - Convergence or global minimum finding is problem
- Low learning rate
 - High training times

Learning Rate decay

- Learning rate decay means the learning rate decreases over time
 - higher learning rate is well suited to get close to the global minimum
 - small learning rate is better at fine tuning the global minimum
- Several way
 - Exponential decay, reduction by factor of n
 - Function to decrease the learning rate by 4%

Overfitting or Underfitting

Weight Penalty

- Adding λ to penalise
 - Keeps weight small
 - Big error derivatives

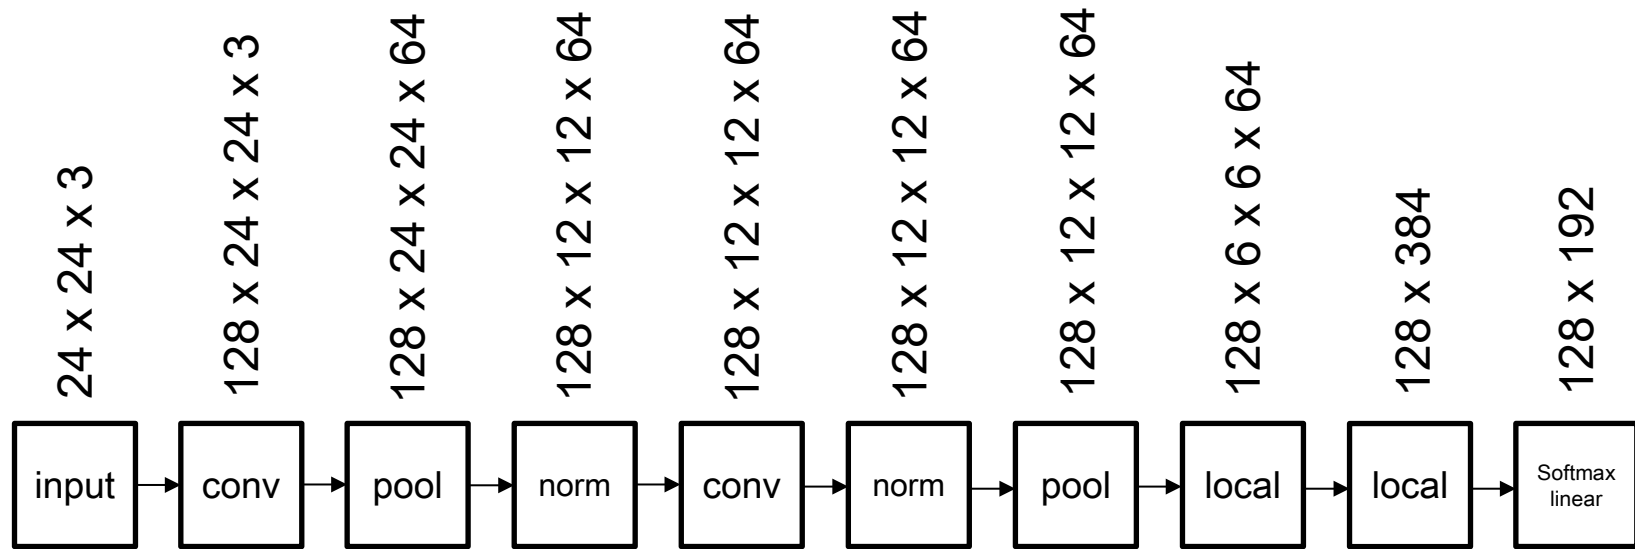

- $C = E + \frac{\lambda}{2} \sum_{i=1} w_i^2$
- $\frac{\partial C}{\partial w_i} = \frac{\partial E}{\partial w_i} + \lambda w_i$
- When $\frac{\partial C}{\partial w_i} = 0$;
 - $w_i = -\frac{1}{\lambda} \frac{\partial E}{\partial w_i}$
 - So, at minimum of cost function if $\frac{\partial E}{\partial w_i}$ is big, the weights are big

Weight Penalty - Advantages

- Preventing network from the weights it does not need
 - Don't have a lot of weights not doing anything
 - So output changes more slowly as input changes.
- Putting half the weight on each and not on one

Structure of the CNN we used

Output: 128×2

PROBLEM

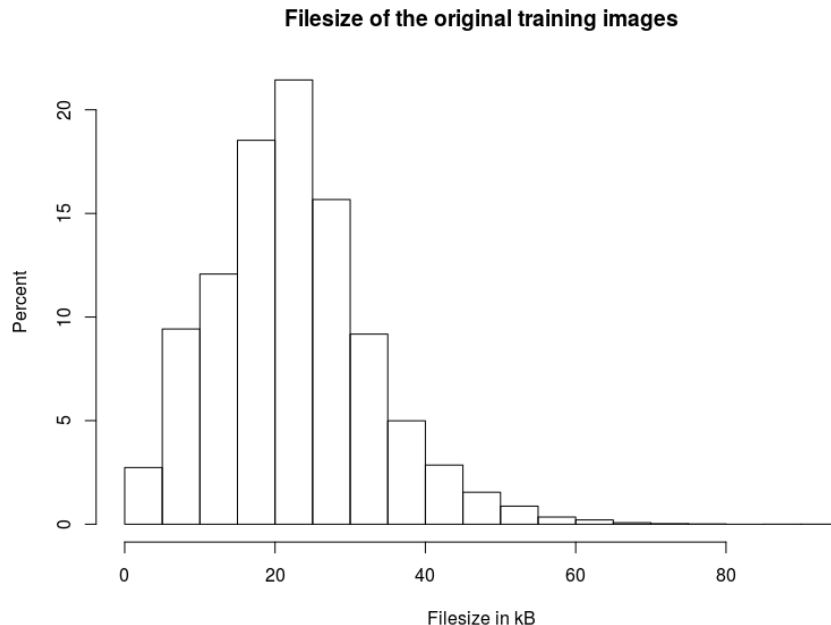

The data

- Images of cats and dogs
- File format is *.jpg
- Color space is RGB

Data

- 25,000 images
 - 12,500 of dogs
 - 12,500 of cats
- Avg. file size
 - 22.34 kB

Train and test data

- Split data
 - Train data
 - 20,000 images (80 percent)
 - Divided into 5 batches containing 4,000 each
 - Test data
 - 5,000 images (20 percent)

Process images

- Resize to $32 * 32 * 3 = 3,072$
- Convert to array
 - $25,000 * 3,073$

dog1.jpg

cat10.jpg

Process images

- Resize to $32 * 32 * 3$
- Convert to array
 - $25,000 * 3,073$
- Example
 - 1; 22; 11; 123; ...
 - 0; 256; 255; 0; ...

dog1.jpg

cat10.jpg

Random distorsion

EVALUATION

Learning rate

Cross-entropy

Total loss

Total loss after 100k steps roughly above 0.1

Summarize

- Understood a CNN
- Trained it
 - Total loss is decreasing over time
 - Precision just above 0.1
