Concept of Neurons

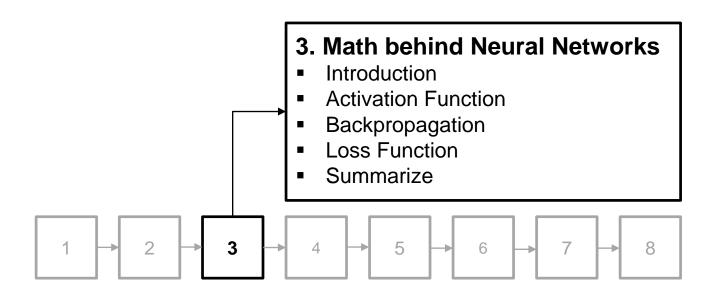

Quelle: http://cs231n.github.io/convolutional-networks/

MATH BEHIND NEURAL NETS

Structure

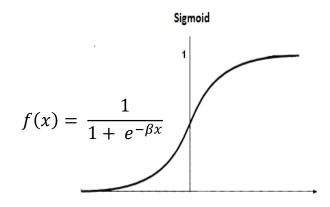

Introduction

- Actual output, weights
- Activation function
- Measure how much we missed (cost function)
- Multiply error by the Sigmoid slope
- Update weights (backpropagation)

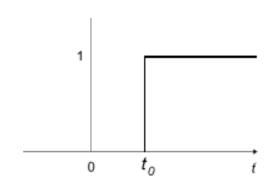

Activation Functions

- Non-Linear
 - Ex: Sigmoid, tanh

- Continuous but not everywhere differentiable function
 - Cons: descent gradient cannot be obtained
 - Ex: Relu

Back Propagation

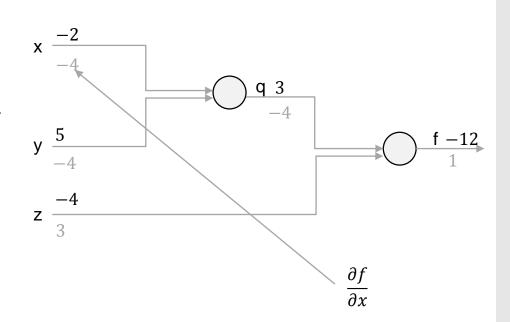

$$f(x,y,z) = (x+y)z$$

•
$$x = -2$$
, $y = 5$, $z = -4$

•
$$q = x + y$$
, $\frac{\partial q}{\partial x} = 1$, $\frac{\partial q}{\partial y} = 1$

•
$$f = qz$$
, $\frac{\partial f}{\partial q} = z$, $\frac{\partial q}{\partial z} = q$

- Desired:
 - $\bullet \quad \frac{\partial f}{\partial x} = \frac{\partial f}{\partial q} \frac{\partial q}{\partial x}$
- Similarly propagate
 - $\frac{\partial f}{\partial y}$ and $\frac{\partial f}{\partial z}$

Loss Function

- Squared Error Measure
- SoftMax

Loss Function - Squared Error Measure

•
$$Error = \frac{1}{2}(Y_{actual} - Y_{predicted})^2$$

- Drawbacks
 - No gradient to get from 0.000...1 to 1.
 - To do so it will take quite longer.
 - Deprives NN of probability information.

Summarize

- Actual output, weights
- Activation function
- Measure how much we missed (cost function)
- Multiply error by the Sigmoid slope
- Update weights (backpropagation)

$$l_0 = T_i, W = rand()$$

$$l_1 = f(X_i . W)$$

$$Err = (l_0, l_1)$$

$$\Delta l_1 = \text{Err} \times \Delta (f(Err))$$

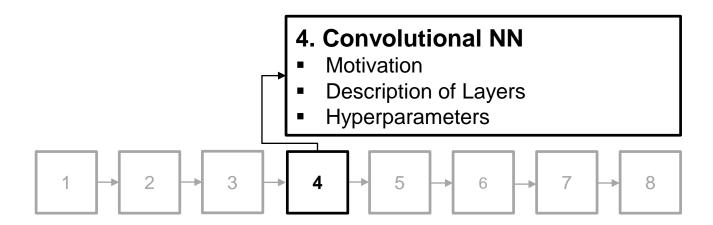

$$W = W + \alpha(l_0.\Delta l_1)$$

CONVOLUTIONAL NN

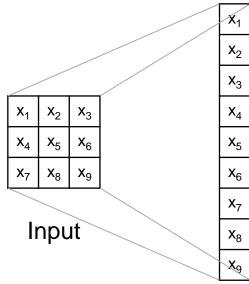

Structure

Motivation

Number of parameters

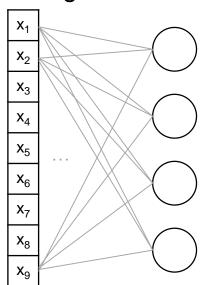

Transformed input

Motivation

- NN
 - High number of params

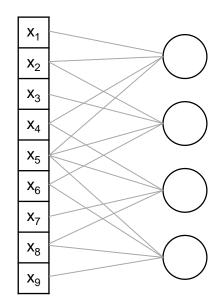

X ₁	X ₂	X ₃
X ₄	X ₅	x ₆
X ₇	X ₈	X ₉

Number of weights: 36

CNN

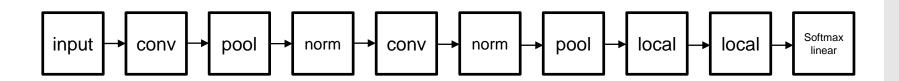

Lower number of params

Number of weights: 4

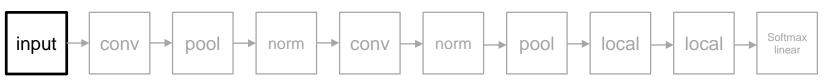

Description of Layers

TU Clausthal

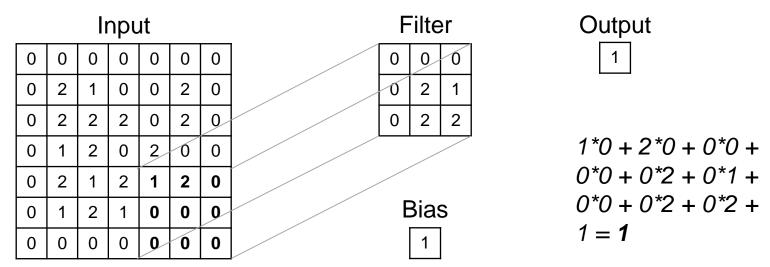

Input Layer

- Image cropping
- Distortions
 - Randomly flipping
 - Randomly changing brightness
 - Randomly changing contrast

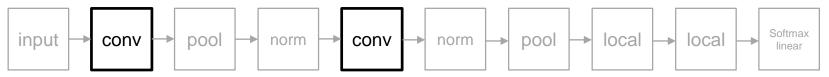

Convolutional Layer - Filter

http://cs231n.github.io/convolutional-networks/

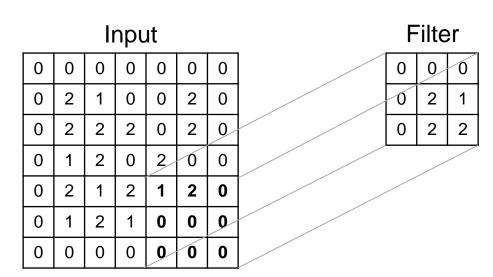

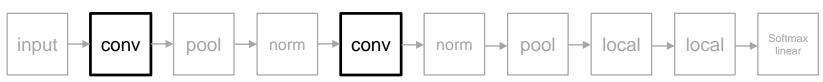

Aditya Raj, Sören Schleibaum Institut für Informatik

Convolutional Layer - Parameters

- Input volume size
- Number of filters
- Filter size
- Step size
- Zero padding

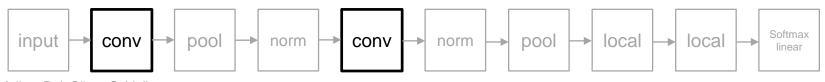

Aditya Raj, Sören Schleibaum Institut für Informatik

TU Clausthal

Convolutional Layer – Activation function

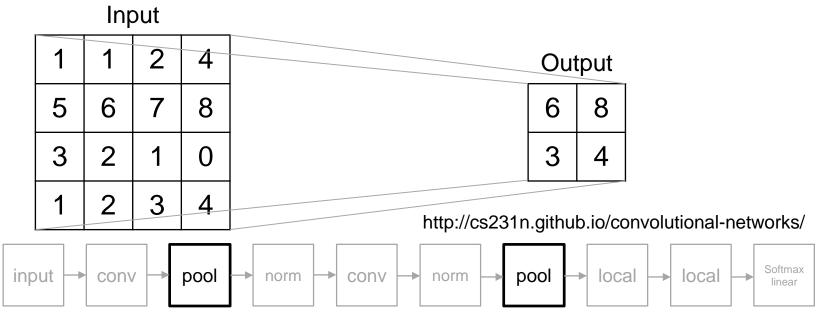

- Rectified linear
 - Element wise max(0, x)
- Leaky ReLu
 - If x < 0 then f(x) = 0.01x
 - Non-zero gradient when the input is negative

Pool Layer – Max Pooling

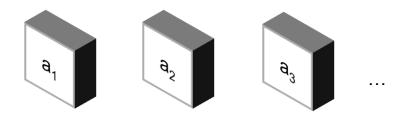

Reduce the spatial dimension of an image

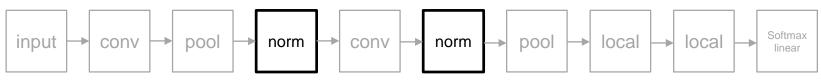

Norm Layer

- 4D-array
- Normalize each element of this array

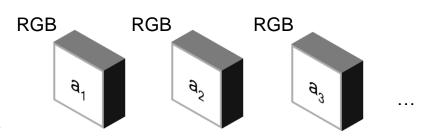

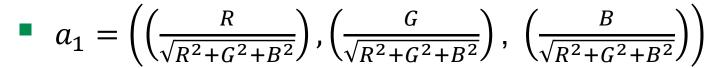

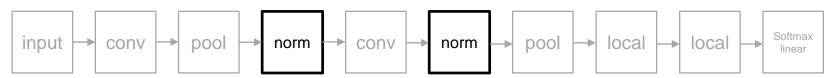

Norm Layer

Normalize each element of this array

TU Clausthal

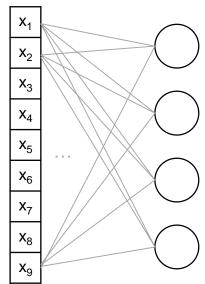

Local Layer

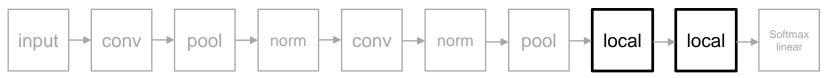

Fully connected

x ₁	X ₂	X ₃
X ₄	X ₅	x ₆
X ₇	X ₈	X ₉

Input

Aditya Raj, Sören Schleibaum Institut für Informatik

TU Clausthal

Softmax-Linear Layer

- Softmax output function
- Cost measure for softmax

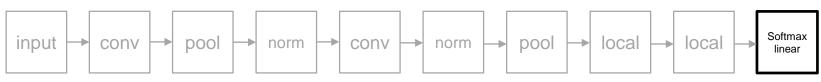

Softmax Output Function

Soft continuous version of Max Function

$$\overline{Y_i} \qquad Y_i = \frac{e^{z_i}}{\sum_j e^{z_j}}$$

• Forces $\sum (Y_i) = 1$.

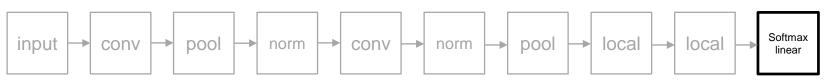

Aditya Raj, Sören Schleibaum Institut für Informatik

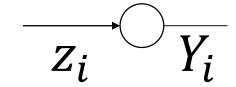

Softmax Output Function

$$\bullet \frac{\delta Y_i}{\delta z_i} = Y_i (1 - Y_i)$$

- Nice Simple derivative
- Even though Y_i depends of Z_i
 - Derivative
 - for an individual neuron
 - of an O/P in respect to I/P is just $Y_i(1 Y_i)$

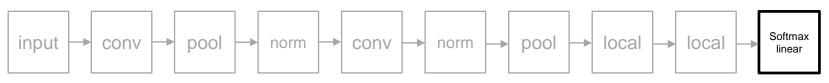

Cost Measure for Softmax

- Cross entropy cost function
 - $C = -\sum_{j} T_{j} \log Y_{j}$
 - Negative log probability of correct answer
 - Maximise the log probability of getting answer right
 - Very big gradient when O/P is 1 and target is 0

$$\bullet \quad \frac{\delta C}{\delta Z_i} = T_i - T_j$$

Slope is -1 when target values and actual value is opposite

Hyperparameters - Learning Rate

- How fast the network trains
- High learning rate
 - Convergence or global minimum finding is problem
- Low learning rate
 - High training times

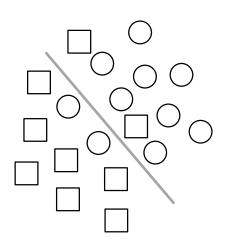

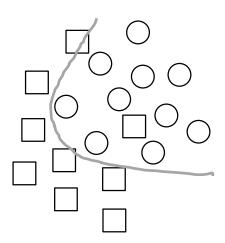

Hyperparameters - Learning Rate Decay

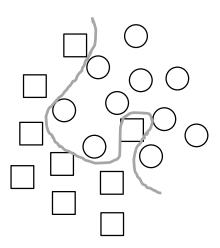

- Learning rate decay means the learning rate decreases over time
 - higher learning rate is well suited to get close to the global minimum
 - small learning rate is better at fine tuning the global minimum
- Several way
 - Exponential decay, reduction by factor of n
 - Function to decrease the learning rate by 4%

Hyperparameters - Overfitting or Underfitting

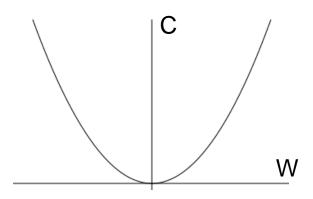

Hyperparameters - Weight Penalty

- Adding λ to penalise
 - Keeps weight small
 - Big error derivatives

•
$$C = E + \frac{\lambda}{2} \sum_{i=1}^{\infty} w_i^2$$

• When
$$\frac{\partial C}{\partial w_i} = 0$$
;

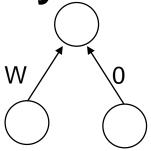

•
$$w_i = -\frac{1}{\lambda} \frac{\partial E}{\partial w_i}$$

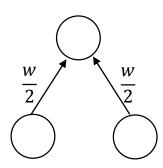

• So, at minimum of cost function if $\frac{\partial E}{\partial w_i}$ is big, the weights are big

Hyperparameters - Weight Penalty

- Preventing network from the weights it does not need
 - Don't have a lot of weights not doing anything
 - So output changes more slowly as input changes.
- Putting half the weight on each and not on one

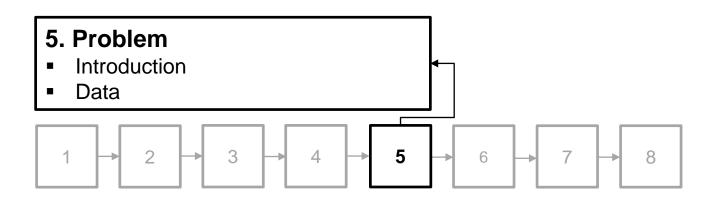

PROBLEM

Structure

Introduction

Data

Images of cats and dogs

File format is *.jpg

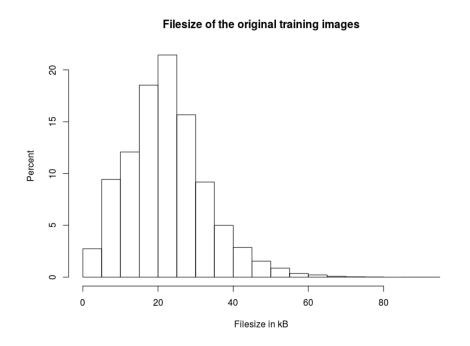

Color space is RGB

Data

- 25,000 images
 - 12,500 of dogs
 - 12,500 of cats
- Avg. file size
 - **22.34** kB

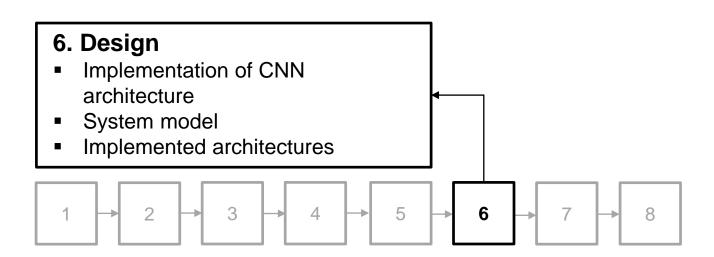

DESIGN

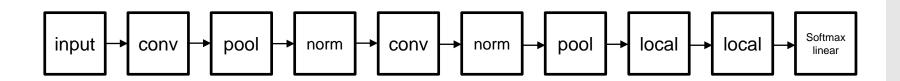

Structure

Implementation of CNN Architecture

Implementation of CNN Architecture

- TensorFlow was developed by Google Brain team
- Use cases
 - Handwritten patterns, image recognition, Word2Vec
- Input data
 - Audio, image, text
- Used techniques
 - Linear classifiers, NN, CNN

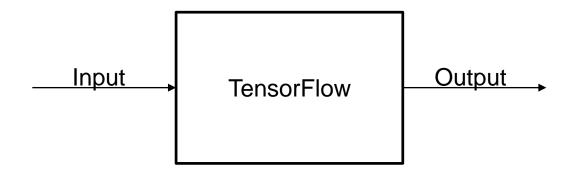

Implementation of CNN Architecture

- Model
- Graph
 - Architecture: nodes and edges
 - Session is placed on device
 - Initialise variables
 - Run
 - Tensors
- Model

System Model

System Model -Train vs. Test Data

- Split data
 - Train data
 - 20,000 images (80 percent)
 - Divide into 5 batches containing 4,000 each
 - Test data
 - 5,000 images (20 percent)

Process images

- Resize to 32 * 32 * 3 = 3,072
- Convert to array
 - **25,000** * **3,073**

dog1.jpg

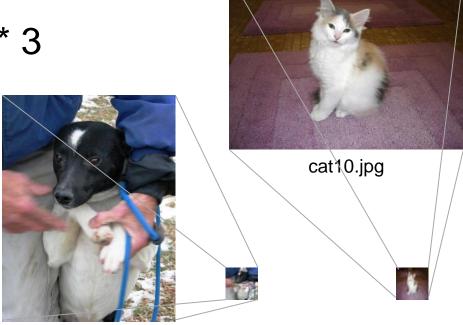

cat10.jpg

Process images

- Resize to 32 * 32 * 3
- Convert to array
 - **25,000** * **3,073**
- Example
 - **1**; 22; 11; 123; ...
 - **0**; 256; 255; 0; ...

dog1.jpg

System Model - Random distorsion

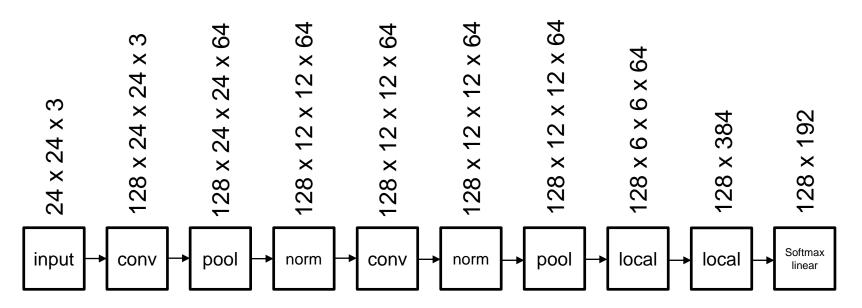

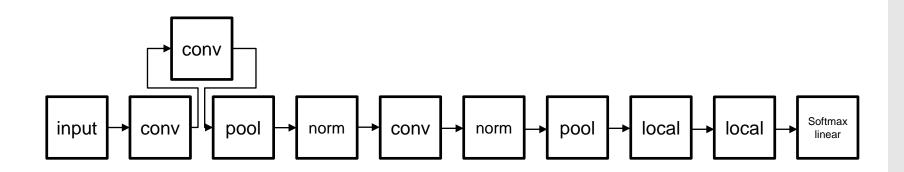

System Model - Structure of CNN

Output: 128 x 2

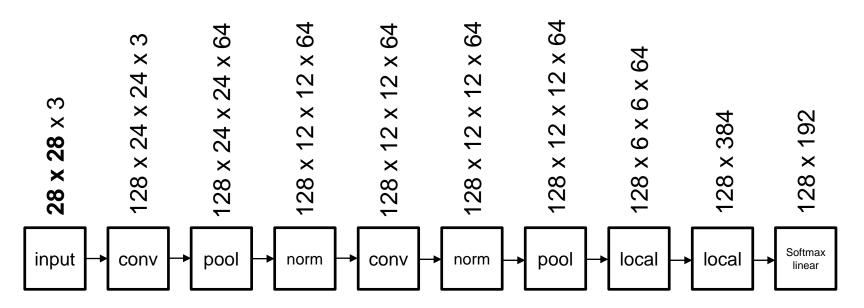

Implemented Architectures – Added Conv Layer

Implemented Architectures – Increased size

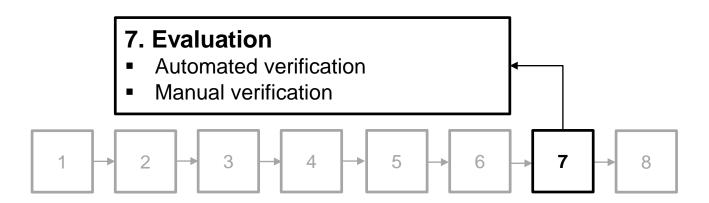

Output: 128 x 2

EVALUATION

Structure

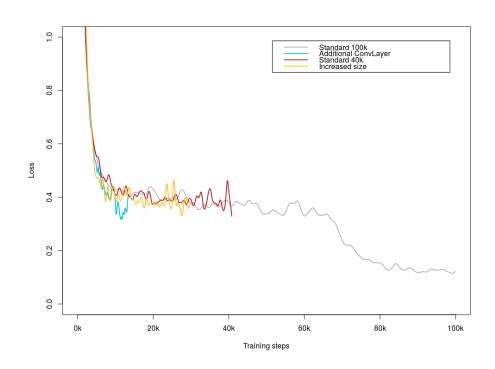

Automated Verification

	Number of steps	Total loss	Time	Machine
Standard 100k	99,900	0.1132	6h 15m 50s	Windows
Standard 40k	40,600	0.3316	8h 26m 58s	Linux
Additional ConvLayer	13,500	0.3128	9h 19m 34s	Linux
Increased size	30,100	0.3446	8h 37m 30s	Linux

Automated Verification

Accuracy of 85 percent

Manual Verification – Correctly Predicted

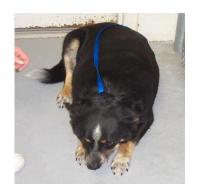

Manual Verification – Wrongly Predicted

Aditya Raj, Sören Schleibaum Institut für Informatik

Manual Verification – Confusing Images
